CMOSTEK

CMT2189BE

27-960 MHz OOK/(G)FSK Transmitter SoC

MCU Feature

- High-performance 8051
 - Single-instruction cycle (1T-8051)
 - Up to 24 MIPS
 - 8kB RAM / 8kB OTP
 - Embedded 512-bit EEPROM
 - 12kB ROM (API function library)
 - Single-wire online simulating and debugging interface
- Digital peripheral
 - Embedded AES-128 accelerator engine
 - Truly random number generator
 - 1x UART
 - 1x SPI
 - 1x WDT
 - 1x RTC (internal 32 KHz only)
 - 2x16 bit multi-functional timer (with PWM/CCP support)
 - 9xGPIO, all supporting level changing interrupt/wake-up
- Analog peripheral
 - Sub-1G transmitter module
 - 12-bit SAR-ADC, 100 ksps, 8-ch
 - Embedded high-speed 3 /12 / 24MHz RC oscillator
 - Embedded low-power 32 kHz RC oscillator
- Code security
 - Embedded multi-level program protection with high confidential performance
 - Series port for programming (S3S interface) with lock function

Application

- Garage door remote control
- Entrance control system remote control
- Wireless remote control in consumer electronics
- Intellegent home auomation
- Home Security
- Active RFID tags
- Wireless sensor network
- WM-Bus T1 mode

Sub-1G Transmitter Feature

- Operating frequency: 27 ~ 960 MHz
- Demodulation mode: OOK, G/FSK
- Data rate:
 - 0.5 ~ 40 kbps (OOK)
 - 0.5 ~ 200 kbps (G/FSK)
- Output power: +13 dBm (Max.)
- Operating current: 18mA@+13dBm, 433.92MHz, FSK
- Single-ended high-efficient Class E transmitter PA
- PA ramping slope varying according to rate

Low-power Feature

- Operating voltage: 2.0 ~ 3.6 V
- Operating temperature: 40 ~ + 85 °C
- Power-off current: 300 nA
- RTC mode: 800 nA

Ordering Information

Part Number	Packaging	MOQ
CMT2189BE-EQR	SOP14, Tube	2,500 pcs

Description

The CMT2189BE is a low-power SoC RF transmitter embedded with enhanced 1T-8051 core:

- 1. The series chips support 27 960 MHz, OOK or (G)FSK modulation wireless transmission function.
- The high-efficient single-ended PA supports adjustable output power ranging in 0 ~ +13 dBm, with +13 dBm transmission consuming merely a power of 18 mA.
- 3. It supports 8 kB OTP program storage and 12 kB ROM (for storage of API function library).
- 4. 1-WIRE online simulation function is adopted. Users can download target debugging code directly to on-chip PRAM to run, through the dedicated 1-WIRE debugger, which can achieve quite convenient debugging rather than traditional OTP chip debugging that requires specific simulator with no support of online simulation and results in quite troublesome operations.
- The support of embedded AES-128 accelerator and truly random number generator (TRNG) as well as 32-bit sequence number (ID) makes it suitable for transmission application scenarios with enciphering requirements, such as remote control and active RFID.
- It supports dual-clock architecture, with the internal high-speed clock supporting system internal running, and the internal low-power RC oscillator supporting low-power timer based wake-up mode operating.
- 7. The embedded 12-bit high-precision and high-speed SAR-ADC is fitting for sensors used in wireless acquisition application scenarios.

Caution! ESD sensitive device. Precaution should be used when handling the device in order to prevent permanent damage.

1 Electrical Specifications

 V_{DD} = 3.3 V, T_{OP} = 25 °C, F_{RF} = 433.92 MHz, matching to 50 Ω impedance, outputting +10dBm power, if nothing else stated. All measurement results are obtained using the evaluation board CMT2189BE-EM if nothing else stated.

1.1 Recommended Operating Conditions

Parameter	Symbol	Condition	Min.	Тур.	Max.	Unit
Operating supply voltage	VDD	Temperature range is -40 $^\circ\!\mathrm{C}~$ ~ +85 $^\circ\!\mathrm{C}$	2.0		3.6	V
Operating temperature	T _{OP}		- 40		+ 85	°C
Supply voltage slope			1			mV/us

Table 1. Recommended Operating Conditions

1.2 Absolute Maximum Ratings

Table 2. Absolute Maximum Ratings^[1]

Parameter	Symbol	Condition	Min.	Тур.	Max.
Supply voltage	VDD		-0.3	3.6	V
Interface voltage	VIN		-0.3	VDD + 0.3	V
Junction temperature	TJ		-40	125	°C
Storage temperature	TSTG		-50	150	°C
Soldering temperature	TSDR	Lasts for at least 30 seconds		255	°C
ESD rating ^[2]	$\mathbf{X}\mathbf{V}$	Human body model (HBM)	-2	2	kV
Latch-up current		@ 85 ℃	-100	100	mA

Notes:

[1]. Exceeding *the Absolute Maximum Ratings* may cause permanent damage to the equipment. This value is a pressure rating and does not imply that the function of the equipment is affected under this pressure condition, but if it is exposed to absolute maximum ratings for extended periods of time, it may affect equipment reliability.

[2]. The CMT2189BE is a high performance RF integrated circuit. The operation and assembly of this chip should only be performed on a workbench with good ESD protection.

1.3 Transmitter Specification

Parameter	Symbol	Condition	Min.	Тур.	Max.	Unit

Notes:

[1]. This item includes the crystal startup time.

[2]. It includes 8051 core current and HFOSC applies the internal 24 MHz high-speed RC as the clock source.

[3]. Baseband data applies 50% high/low duty cycle.

1.4 Oscillator Specification

Parameter	Symbol	Condition	Min.	Тур.	Max.	Unit	Parameter
	Crystal frequency ^[1]	F _{HXOSC}			26		MHz
	Frequency precision ^[2]				±20		ppm
High-frequency	Load capacitance	C _{HX-LOAD}			15		pF
crystal oscillator	Equivalent series	D				C 0	0
	resistance	R _{HX-ESR}				60	Ω
	Startup time [3]	t _{HXOSC}			400		us
Internal	RC oscillating						
high-frequency	frequency	F_{HF_RC}		3	24	24	MHz
RC oscillator	Frequency precision ^[4]				1		%
Internal 32 KHz	Oscillator frequency	F _{LP_RC}			32		kHz
		I LP_RC			52		
RC oscillator	Frequency precision ^[4]				1		%

Table 4. Oscillator Specification

Notes:

- [1]. The CMT2189BE can directly use an external reference clock to drive the XTAL pin. The peak-to-peak level of the external reference clock is required between 0.3 and 0.7 V.
- [2]. It involves:(1) initial tolerance, (2) crystal loading, (3) aging, and (4) temperature changing. The acceptable crystal frequency tolerance is subject to the bandwidth of the receiver and the RF tolerance between the receiver and its paired transmitter.
- [3]. This parameter is to a large degree crystal dependent.
- [4]. The frequency precision is the value after calibration that is related to environmental factors. Users can call the related calibration API initiatively to have calibration.

1.5 **EEPROM Specification**

Parameter	Symbol	Condition	Min.	Тур.	Max.	Unit
Powriting time		Call eeprom_write_words to operate ^[1]		14		ms/unit
Rewriting time	t _{EE-WR}	Call eeprom_set_dec_count to operate [2]		42		ms
Number of		Call eeprom_write_words to operate ^[1]	10,000	100,000		cycles
programming times		Call eeprom_set_dec_count to operate [2]		1,000,000		cycles

Table 5. EEPROM Specification

Notes:

- [1]. The internal EEPROM is re-written by calling API eeprom_write_words for direct re-writing, and the operation address points to a 2-byte storage unit, namely, each unit is 2 bytes.
- [2]. The internal EEPROM is re-written by calling API eeprom_set_dec_count for enhanced re-writing. By applying Balanced Gray Code algorithm, it can endure more than 1,000,000 writing operations. It should be noted that the function is fixed to operating 3 units, namely, this field occupies 6 bytes with only the lower 22 bits data valid in the written value and the read value.

1.6 High-precision ADC Performance Parameter

Devenueder	Cumbal	Condition	841 in	Turn	Mex	11++:4
Parameter	Symbol	Condition	Min.	Тур.	Max.	Unit
Resolution	RADC			12		bit
Effective number of bits	NOEB			10		bit
Conversion input range	V _{AIN}		0		V _{REF}	V
ADC clock frequency	f _{ADC}		0.5	1.0	2.0	MHz
ADC total conversion time	t _{CONV}		16	16	25	
Sampling time ^[1]	t _{SAMP}		2	2	8	4.15
Successive approximation conversion time [2]	t _{SAR}		13	13	16	1/F _{ADC}
Data update time	t _{UPDATE}		1	1	1	
ADC data refresh rate	f _S	$F_{ADC} = 1 \text{ MHz}$		62.5		kHz
Stabilization time ^[3]	t _{STAB}				10	uS
Offset error	Eos	F _{ADC} = 1 MHz		±4		LSB
Gain error	E _G	F _{ADC} = 1 MHz		±4		LSB
Integral nonlinearity error	INL	F _{ADC} = 1 MHz		±3		LSB
Differential nonlinearity error	DNL	F _{ADC} = 1 MHz		±2		LSB

Table 6. High-precision ADC Performance Parameter Specification

Parameter	Symbol	Condition	Min.	Тур.	Max.	Unit
ADC reference voltage						
Regulator output	N			V_{DDA}		V
Bandgap reference	V _{REF}			1.2		V
External input reference [4]		Input from pin B6	1.0		V _{DDA}	
Supply voltage range	V _{BAT}		2.0		3.6	V
Operating voltage range	V _{DDA}		2.0	2.2	3.6	V
Operating current	I _{ADC}	V _{DDA} = 2.2 V		220		uA
Power efficiency	P _E			7.6	\wedge	pJ/Conv
Leakage current	I _{LEAKAGE}			2.2		nA

Notes:

[1]. The sampling time can be configured by software. See AN281 CMT216xA ADC and AFE User Guide or CMT216xA User Guide for details.

[2]. The successive approximation conversion time can be configured by software. See AN281 CMT216xA ADC and AFE User Guide or CMT216xA User Guide for details.

[3]. The stabilization time refers to the analog circuit stabilization time after power-on, which depends on the system design.

[4]. The external input reference voltage must be at least 1.0 V, otherwise the circuit may not work properly.

1.7 Supply Voltage Detection Specifications

Table 7. Supply Voltage Detection Specifications

Parameter	Symbol	Condition	Min.	Тур.	Max.	Unit
Battery measuring error [1]	V _{ERR}		-50		+50	mV
Battery sensor circuit establishing time	t stab				5	uS
Notes:

Table 10. CMT2189BE Pin Description

3 Functional Description

Embedded with a Sub-1 GHz OOK / (G)FSK transmitter, the CMT2189BE is a high-performance 8051 SoC, suitable for low-power wireless transmission applications in the 27 - 960 MHz band. The series chips integrate the below major modules.

- High-performance 8051 core with enriched peripheral resources.
- Sub-1G OOK / (G) FSK transmission module.
- Multi-channel 12-bit high-precision successive approximation ADC.

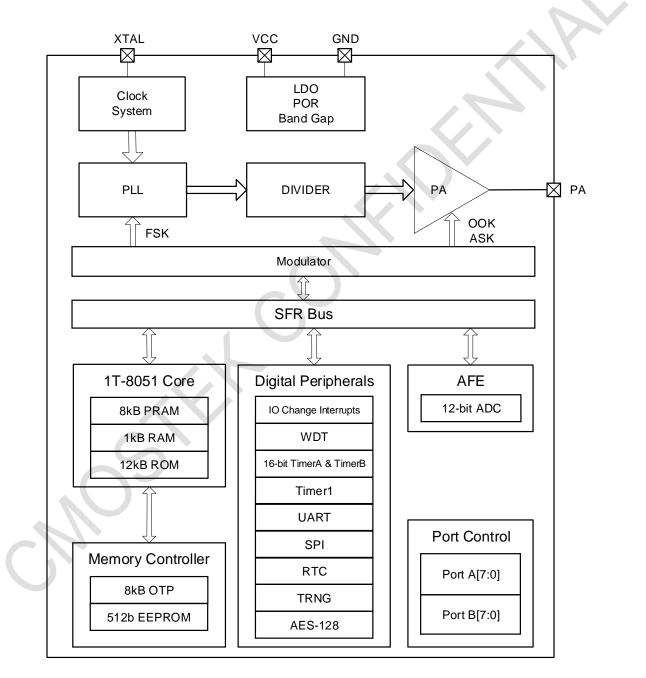

Figure 4. System Block Diagram

3.1 High-performance 8051

Built-in with enhanced 1T-8051 and 24 MHz high-speed RC oscillator, the CMT2189BE supports dual-clock operating mode. achieving 24 MIPS high-speed operating. Meanwhile, the low-speed clock is provided by the internal low-speed 32 kHz RC oscillator, serving as the clock source of the low-power RTC.

As for memory architecture, the on-chip 8 kB OTP ROM is for code storage, 8 kB PRAM for code running, 1 kB XRAM for data storage and 512 bits EEPROM for key data storage in case of power loss. Meanwhile, it integrates 12 kB MASK ROM for the storage of API library function of various chip modules.

For digital peripherals, it supports on-chip AES-128 operation acceleration engine, true random number generator, one UART, one SPI, watchdog, two 16-bit multi-function timers, one RTC, and 10 ports with multiplexing functions.

As to development and debugging, the CMT2189BE adopts 1-wire debugging interface, which requires only one single wire connecting to the debugger to download code to PRAM, achieving simple and convenient online debugging.

3.2 Sub-1G Single Transmitter

The CMT2189BE integrates a high-performance Sub-1G single transmitter which applies single-ended Class E PA architecture with transmission power reaching up to +13 dBm with only a power consumption of 18 mA.

The transmitter supports 3 modulation modes, OOK, GFSK and FSK. Appling the fractional phase-locked loop technology, it requires only one 26 MHz crystal oscillator to achieve most of the 27~960 MHz band coverage.

3.3 12-bit High-precision ADC

Embedded with a multi-channel 12-bit high-precision successive approximation ADC along with a buffer based operational amplifier, it can fulfill high-resistance signal conditioning, fit for a variety of sensor acquisition applications.

CMOSTEK does not give warranties as to the accuracy or completeness of the included information herein and shall have no liability for the consequences of use of the information supplied herein.

CMOSTEK assumes no responsibility for any infringement of patents, copyrights and other intellectual property rights of third parties arising from the use of the products listed in this document. Nothing contained in this document should be construed as license or authorization (express or implied) of CMOSTEK for patents, copyrights or other intellectual property rights owned by other companies or individuals.

The circuits, software, and related information in this document are provided only to illustrate the operation and application examples of the semiconductor products. Users should take up full liability for the application of the circuits, software and related information in this document in their device design. CMOSTEK assumes no responsibility for any loss of users or other third-parties caused by the use of the above circuits, software and related information.

CMOSTEK products are not authorized for use as critical components in life support devices or systems. CMOSTEK assumes no responsibility for the loss caused by the malfunction of the devices or systems that use CMOSTEK products.

Although CMOSTEK is committed to improving the quality and reliability of its semiconductor products, users should be aware and agree that CMOSTEK still cannot completely eliminate the possibility of product defects. In order to minimize the risk of damage to people and property (including death) caused by the failure of our semiconductor products, users must adopt the necessary safety measures such as redundancy, fire prevention and failure prevention in their design.
